

“A New Global Infrastructure for Payments”

BULLIONBLOCK is designed to connect diverse financial systems and allow anyone to facilitate low cost digital financial transactions – local or global payments and remittances – for their business, family and/or community.

We are focused on providing better options for international transfers, particularly mobile digital transactions, and with the integration of BULLIONBLOCK onto the Stellar Blockchain network we are one step closer in delivering our company charter.

For example, Stellar has enabled low cost global money transfers to the Philippines, India and Europe, and cross-border M-Pesa payments to and from Kenya, Ghana and Nigeria. The Stellar Blockchain technology is for example an open source SWIFT-like network.

The Stellar technology will enable the BULLIONBLOCK money transfers to be a lot quicker and cheaper than current transfer options, with lower error rates and lower vulnerability to cyber threats.

The BULLIONBLOCK platform moves money directly between people and businesses as easily as email, providing more access and autonomy for individuals over their money, lower costs for money transfers and increased revenue for businesses.

As a unifying layer between all payments and currencies, the BULLIONBLOCK ecosystem is able to link siloed financial institutions and services, and reduce the friction that contributes to higher fees. This interoperability substantially lowers global remittance costs by making transactions that cross national boundaries, much more efficient.

Transactions processed on the BULLIONBLOCK platform will take between three to five seconds to complete, and are extremely low cost regardless of the currency amount transferred – these attributes make the platform uniquely suitable for international and local money transfers.

BULLIONBLOCK is an effective Payment Gateway that is easy to use, fast, inexpensive and accessible to everyone worldwide from any device.

The BULLIONBLOCK platform can be used for B2B (business-to-business) payments by small and medium sized (SME) businesses processing local and/or international financial transactions. In addition, BULLIONBLOCK benefits B2E (business-to-employee) and G2C (government-to-consumer) by reducing remittance fees, payroll costs and error rates.

In 2019, BULLIONBLOCK will launch a blockchain decentralized global financial technology ecosystem backed by physical bullion - a paradigm shift in money transactions - enabling anyone from anywhere to manage their money from any device.
